Authors and contributions

GUIDANCE FOR THE TEAM (delete before submission)

- The spec requires this table at the start of the report: every author's contribution to each section.
- Fill each cell (for example 'researched and drafted', 'reviewed', 'built the diagram'). It must agree with Appendix C and the Blackboard discussion area.
- Notes on the spec PDF say Strategic Analysis was led by Thisen and Ranuli and the initial long list by Diddy and Manthi. Confirm and complete.

1 Introduction

GUIDANCE FOR THE TEAM: Introduction, 5% (delete this box before submission)

- Top band: 'clear, concise, highly engaging introduction explaining the purpose, context, scope, and provides an insightful overview of the sustainability or sector'.
- Suggested length: about 150–170 words over the three parts below.

Verified facts you could use (full references in 07_References.docx):

- THE Impact Rankings 2025 covered 2,526 universities in 130 countries; in 2026 THE replaced them with Sustainability Impact Ratings covering 1,646 universities (Times Higher Education, 2025; 2026).
- UI GreenMetric 2026 included 2,016 universities from 110 countries (Ada Derana, 2026). Only six Sri Lankan institutions were ranked in 2025, all state universities (UI GreenMetric, 2025a).
- Sri Lankan universities face 'poor data management, inadequate funding, and a weak sustainability-driven culture' (Daily Mirror, 2025).
- Client context from the brief: Sustainability Office, Head of Sustainability, Digital Transformation Lead, LKR 80m over three years, Ratmalana move, 2030 ambition, seven draft goals (IIT, 2026a).
- Do not use the '8,200 students' figure unless you find its source; it could not be verified.

1.1 Purpose and scope of the report

[Team to write, about 50–60 words]

1.2 Sustainability in the higher education sector

[Team to write, about 50–60 words]

1.3 IIT context and the client brief

[Team to write, about 50–60 words]

2 Strategy Development Approach

GUIDANCE FOR THE TEAM: Strategy Development Approach, 5% (delete this box before submission)

- Top band: 'thorough, logical, well explained and justified with clear steps and connections'.
- About 150–170 words plus Figure 1. Explain the steps, why they come in this order, and how each fed the next.

Your process as it appears in your drafts (check it is accurate and add anything missing):

- Desk research on IIT, the HE sector and Sri Lanka, then the external analysis (PEST) and internal analysis (McKinsey 7S).
- Key insights (7S I1–I3; external insights still to write), then a long list of 8 initiatives and 8 alternatives.
- Evaluation criteria and scoring (still to agree), then the programme and the MVP, the Value Proposition Canvas and process map, then the digital strategy and roadmap.
- Also cover: the three Strategic Review Meetings and what changed (Appendix B), GenAI use, and the lack of measured IIT data, so assumptions are declared (Appendix D).

2.1 Overview of the approach

[Team to write, about 80 words]

[Insert Figure 1 here: a simple flow diagram of your approach]

Figure 1: Strategy development approach [team to create]

2.2 Research methods, evidence and assumptions

[Team to write, about 80 words]

3 Strategic Analysis

3.1 External environment analysis: PEST

PEST is the single external framework because the brief asks for an analysis of the wider sustainability and higher-education context, and PEST sorts that macro environment into four manageable categories (Johnson et al., 2020). Legal and Ecological aspects are not separate headings: law and ecology act on all four categories, so each factor carries a [Legal] and/or [Eco] tag where either applies (for example, tariff regulation under Economic, or cyclone damage under Economic and e-waste under Technological). Impact in brackets (High, Medium, Low) shows how strongly a factor affects IIT's seven sustainability goals.

Table 1: PEST analysis of IIT's external environment (impact on IIT's seven goals: High, Medium or Low)

Criteria	Factors	Opportunity	Threat
Political	Energy policy [Legal]: 70% renewable electricity target by 2030 (Government of Sri Lanka, 2025); net metering closed to systems connected after 5 March 2026, and new systems get Net Plus feed-in tariffs of LKR 15.81–23.11/kWh depending on size (Bellini, 2026)	Direction backs the 40% on-site solar goal and rewards self-use, pointing to real-time metering and load management (High)	Exports earn far less than grid power costs and the rules keep changing, so solar only pays if used on site (High)
	Waste and plastics rules [Legal][Eco]: single-use plastic bans weakly enforced (Silva and Ihalagedara, 2026); state bottle-purchase ban from May 2026 (Eco-Business, 2026); Extended Producer Responsibility (EPR) now has a legal basis in the National Environmental (Amendment) Act No. 15 of 2026 (Sunday Times, 2026a); e-waste via licensed handlers (CEA, n.d.)	Plastic-free canteens (Goal 3) sit ahead of regulation, and the campus can partner with producers and recyclers who need collection points (Medium)	Goal 2 needs licensed handlers and a provable chain of custody per device, and private institutions may be next (High)
	Data protection [Legal]: Personal Data Protection Act No. 9 of 2022 (amended 2025): core duties on processing, controllers and processors apply from 1 January 2027, with data-subject rights and penalties	Privacy-by-design (anonymised data, opt-in tracking) builds trust and meets the brief's privacy trade-offs (Medium)	Apps, sensors and nudges process personal data, needing a lawful basis, notices and possibly an impact assessment (Medium)

	to follow (Ceylon Public Affairs, 2026)		
	Climate and higher-education governance [Legal][Eco]: Paris Agreement and 2050 carbon-neutrality goal; Sustainable Development Act No. 19 of 2017; IIT's degrees come via Westminster, and no local regulator requires sustainability reporting (British Council, 2024)	SDG-aligned goals fit national direction, and voluntary reporting lets IIT differentiate early and attract SDG funders (Medium)	Westminster's own reporting expectations may flow down, and ESG criteria could enter private-HE quality rules (Medium, uncertain)
	Stability and fiscal priorities: stable since the 2024 elections, but public finances are tight under the IMF programme	Stability supports a multi-year plan, and short policy cycles favour phased, quick-payback delivery (Medium)	Government subsidy cannot be assumed; funding is the LKR 80m budget plus reinvested savings (Medium)
Economic	Growth and external shocks [Eco]: GDP +4.2% in Q2 2026 (DCS, 2026a); Cyclone Ditwah damage of USD 4.1bn, about 4% of GDP (World Bank, 2025); Middle East conflict and oil near USD 89 a barrel (Daily Mirror, 2026a; Daily FT, 2026a)	Growth supports investment capacity, and cutting imported-energy exposure is a financial hedge as well as a carbon measure (High)	A second energy or weather shock could reverse growth and raise fuel and construction costs (High)
	Inflation and interest rates: inflation 8.0% in August 2026, high single digits to early 2027, then easing to 5%; policy rate 8.75% (CBSL, 2026)	Favours self-funding, leasing or power-purchase agreements, and quick-payback tools such as metering (Medium)	At 8% a year, prices rise about 26% over three years, so the budget's buying power falls by about a fifth (about 14% at 5%), and borrowing is costly (High)
	Exchange rate and imports: rupee 7.9% weaker against the USD in the first half of 2026, then mixed (EconomyNext, 2026; CBSL, 2026)	Favours reusing existing equipment, software over hardware and early purchasing (Medium)	Meters, sensors, panels, batteries and cloud services are USD-priced, so quote with an FX buffer of about 10% (High for

			hardware)
	Utility prices [Legal]: PUCSL raised electricity tariffs from 1 April 2026 (8% households, 14.4% government) and by 18% from 11 May for heavy domestic users, GP-2/GP-3 general-purpose users and large industry (Newsfirst, 2026; Daily Mirror, 2026b; Vibhawa Consultants, 2026); water tariffs held for H1 2026 (Newswire, 2026)	Each kWh or litre saved is worth more, and time-based tariffs would reward shifting loads away from evening peaks (High)	Costs may outrun the budget, and the next water review could raise charges; IIT's billing category is unconfirmed (Medium)
	Labour market and affordability: unemployment 4.0% in Q2 2026, 12.1% for ages 25 to 29 (DCS, 2026b); inflation squeezes household budgets; strong demand for private HE (British Council, 2024)	A weak youth job market raises the value of IIT's employability offer and industry-partnered projects (Goal 5) (Medium)	Price-sensitive families make fee rises risky, so initiatives must save money, earn income or be partner-funded (Medium)
Social	Student and staff values: about 8,200 students (Sunday Times, 2025); 66% of Sri Lankan youth see climate change as the biggest threat and 70% see themselves as awareness agents (Daily FT, 2021), yet only 34% can explain it (UNICEF, 2021)	Visible sustainability performance can attract eco-conscious applicants and engage students as advocates (Medium)	Concern outruns knowledge and action, so engagement must educate; missing rising expectations could hurt reputation and enrolment (Medium)
	Sector and competitors: UI GreenMetric 2025 ranks Peradeniya #186 and Kelaniya #189 worldwide (UI GreenMetric, 2025a); 2,016 universities entered in 2026 (Ada Derana, 2026); NSBM brands itself a Green University (Iddawela and Yatawara, 2021); sector weaknesses include poor data management and weak sustainability culture (Daily Mirror, 2025)	Rankings (Goal 7) are visible and measurable, and IIT's planned data platform targets the sector's common weakness, a basis to differentiate (High)	Rivals with established green credentials may draw students away, and late entry means catching up (Medium)
	Campus culture: sustainability work is led by individual clubs and	Building on existing clubs and lecturers gives	Individual-led activity lacks consistency

	lecturers, uncoordinated and unmeasured (IIT, 2026a)	quick, low-cost momentum; collaboration and existing resources drive results elsewhere (Daily Mirror, 2025) (Medium)	without institutional backing (Medium)
	Geography and accessibility [Eco]: Ratmalana is about 13 km south of central Colombo (Rome2rio, n.d.) on the Galle Road and coastal rail corridor, near the Attidiya Bird Sanctuary (Lakpura, n.d.)	Rail and bus links support low-carbon commuting, and nearby wetland supports green-cover goals (Goals 1 and 4) (Medium)	Commuting is probably a large unmeasured Scope 3 source, a move further out could push students to private vehicles, and flood exposure needs checking (Medium, to verify)
Technological	Connected buildings [Eco]: cheaper sensors, meters and cloud platforms enable near-real-time monitoring; AI-led building optimisation could save about 300 TWh worldwide but is held back by weak digitalisation (IEA, 2025)	Technology is mature, so IIT must integrate its existing smart meters, not invent; Ratmalana lets monitoring be built in (High)	With no baseline, IIT cannot set credible targets, prove savings, report to GRI or enter rankings (IIT, 2026a) (High)
	Clean energy: utility-scale solar cost fell about 90% in 2010 to 2024 (IRENA, 2025); rooftop solar passed 1,700 MW in Sri Lanka by May 2025 (Ada Derana, 2025)	40% on-site solar is technically realistic with an established installer market (High)	Value depends on export-tariff rules and USD-priced hardware, and unmeasured generation cannot justify more investment (Medium)
	AI and analytics [Eco] [Legal]: AI can forecast renewable output and optimise loads, but data-centre demand may rise from about 415 TWh in 2024 to about 945 TWh by 2030 (IEA, 2025); UNESCO urges privacy-aware use (Miao and Holmes, 2023)	AI can forecast demand, spot waste and give final-year students real projects (Medium)	AI adds to IIT's own energy footprint and data-protection duties, and only pays off on a sound data base (Medium)
	E-waste [Eco][Legal]: 62 billion kg generated	Asset registers, lifecycle tracking	As an IT-heavy institution with no

	worldwide in 2022, 22.3% documented as recycled (Baldé et al., 2024); Sri Lanka produces about 110,000 tonnes a year (Hussein, 2025), and producer take-back was voluntary until the National Environmental (Amendment) Act No. 15 of 2026	and reuse schemes are cheap and mature, supporting a five-year device life (Medium)	end-of-life tracking (IIT, 2026a), IIT carries reputational risk if disposal is poor (High)
	Connectivity: 13.9 million internet users, 59.7% penetration, about 9.4 million offline (DataReportal, 2026); National Digital Economy Strategy 2030 (Daily FT, 2024)	Connected students and staff will adopt apps and dashboards, and the model can later be shared with others (Medium)	Underserved youth in Goal 6 may lack connectivity, so outreach must be mobile-first and partly in person (Medium)

3.2 Internal environment analysis: McKinsey 7S

Why we used the McKinsey 7S model

The brief allows one internal framework. We chose the McKinsey 7S model, which examines three "hard" elements (strategy, structure, systems) and four "soft" ones (shared values, style, staff, skills) (Waterman, Peters and Phillips, 1980). It is purely internal, so it complements our PEST analysis; it covers the whole organisation; and, most importantly, it tests how well the elements fit together. IIT's problem is not ambition but fit, which a list of strengths and weaknesses would not reveal.

We rejected the value chain (Porter, 1985), which suits product firms rather than universities, and VRIO (Barney, 1991), which tests competitive advantage rather than readiness for change. The 7S is a qualitative snapshot that ignores external forces, so we pair it with PEST, support each element with evidence and benchmarks, and declare our assumptions (Appendix D).

Table 2 compares IIT today with its target of regional excellence (IIT, n.d.a) and becoming Sri Lanka's leading sustainable technology campus by 2030 (IIT, 2026a). Gaps are rated Large (blocks the goal now), Medium (slows progress) or Small (already supports it).

Table 2: McKinsey 7S analysis of IIT: current status, enablers and barriers, and size of the gap

7S element	Current status	Enablers (+) and barriers (–)	Gap to 2030 target
Strategy *Hard S*	35-year provider of British IT and Business degrees via twelve partners, now with its own UGC-approved BBA (IIT, n.d.a; IIT, 2026c). Seven draft sustainability goals; LKR 80m over three years (IIT, 2026a).	+ A clear market position and a distinctive 2030 goal. + Funding committed to a phased programme. – No baseline, so progress cannot be measured. – A fixed budget and one developer force tight choices.	**MEDIUM** Ambition is clear; a costed, measurable plan is not.
Structure *Hard S*	Functional structure with a strong strategic apex (Mintzberg, 1979): central management, subject-based schools and units added over time (Appendix E). New Sustainability Office (IIT, 2026a).	+ Fast, top-down decisions.* + The Ratmalana move allows a fresh operating model. – Silos between schools, IT and facilities (Johnson et al., 2020). – The Sustainability Office has no authority over schools, IT or facilities.* NSBM runs its sustainability policy under its Vice-Chancellor (Iddawela and Yatawara, 2021).	**LARGE** Sustainability has an owner but no power.
Systems *Hard S*	ISO 9001:2015, UGC, TVEC and BCS approvals (IIT, n.d.a). Smart-meter and recycling data not consolidated; no baseline, IT end-of-life process or public reporting (IIT, 2026a).	+ An audited quality system that sustainability procedures can join. + Existing IT infrastructure and meters can be reused (IIT, 2026a). – No joined-up data. Monash measured and reported its emissions for a decade before committing to net zero (UNFCCC, 2018).	**LARGE** IIT cannot manage what it does not measure.
Shared values *Soft S*	Regional-excellence vision; eleven values, including community engagement, which mentions sustainable development (IIT, n.d.a).	+ Lived through the SDGP module, which builds apps for the UN SDGs (IIT, n.d.b), and ICSE 2026 (IIT, 2026b). – Eleven values are too many to guide choices; sustainability is not core. NSBM made a sustainability module compulsory for all first-years (Iddawela and Yatawara, 2021).	**SMALL** The 2030 goal fits who IIT already is.
Style *Soft S*	Entrepreneurial, founder-led and first to market; runs LeapGen (IIT, n.d.a; IIT, n.d.c). Sustainability work is bottom-up via clubs and lecturers (IIT, 2026a).	+ Quick, committed decisions, such as ring-fencing LKR 80m. – No middle layer turns activity into measured results. – Relies on a small number of senior people.*	**MEDIUM** The energy is there; accountability is not.
Staff *Soft S*	Engaged students and award-winning clubs (IIT, n.d.a); teaching-focused lecturers*; small Sustainability Office plus final-year students (IIT, 2026a).	+ Growing concern about climate change (IIT, 2026a). + Final-year projects add low-cost capacity. – Little spare staff time outside teaching.* – Students leave yearly, so knowledge is lost.	**MEDIUM** Motivated people, limited capacity.
Skills *Soft S*	Software engineering, AI, data science and analytics; national competition winners (NBQSA, IEEE Innovation Nation) (IIT, n.d.a).	+ The skills needed to build data tools in-house. – No carbon accounting, GRI reporting or e-waste expertise.	**MEDIUM** A strong technical base, but missing specialist knowledge.

Key: + enabler – barrier * assumption, explained in Appendix D

[TEAM TO ADD BEFORE SUBMISSION: two or three points from our own campus observation, e.g. in the Systems or Staff rows, cited as (team campus observation, November 2026). Delete this note once done.]

How the elements fit together

The 7S assumes the elements must reinforce each other (Waterman, Peters and Phillips, 1980). Figure 2 shows three misfits:

- **M1 Strategy and Systems:** targets exist, but no system produces the data to track them.
- **M2 Style and Structure:** activity relies on clubs and lecturers, but no one has authority to coordinate it.
- **M3 Skills and Staff:** the skills to build tools sit largely with students who leave each year.

Strong shared values mean these gaps can be closed without changing IIT's identity.

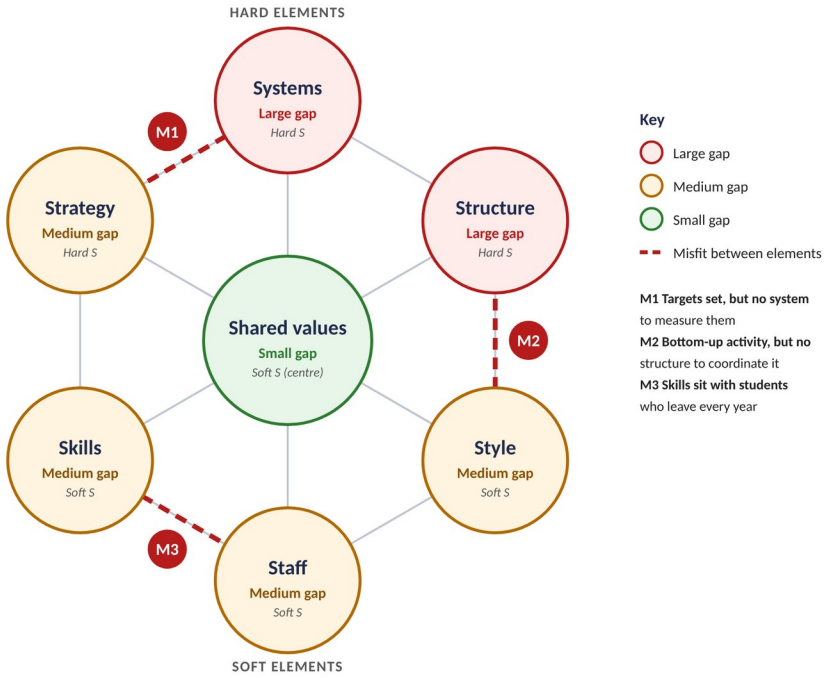

Figure 2: 7S fit: gap per element and the three main misfits (own analysis)

Key insights for the strategy (7S I1–I3)

- **I1 Measure first.** Systems is the largest gap and blocks every goal, so data consolidation comes first.
- **I2 Give sustainability authority, not just an owner.** A cross-functional mechanism is needed, not a costly restructure.
- **I3 Use IIT's own skills, but keep the knowledge.** Document and hand over work between cohorts, and add specialist skills through training or the Westminster partnership.

Our recommendations refer to these as 7S I1–I3. Appendix E gives the organisation chart and a fuller assessment of IIT's structure.

3.3 Key strategic insights

GUIDANCE FOR THE TEAM: Key strategic insights (delete this box before submission)

- The spec asks the analysis to identify 'key factors and strategic insights'. A short table linking each insight to the recommendations strengthens the 'alignment' marks later.
- Internal insights are already written in 3.2 (7S I1–I3).
- External insights still need writing (about 3 or 4). Draft them from the PEST rows you rated High: energy policy (net metering ended, so on-site use matters), utility tariffs (+18% for GP-2/GP-3), inflation and the exchange rate eroding the budget, rankings and competitors, connected buildings with no baseline, clean energy, and e-waste (EPR Act 2026). The PDPA timing (1 January 2027) also matters.

Table 3: Key strategic insights and where they are used [team to complete]

Insight	Evidence (framework and row)	What it means for IIT	Used in (initiative)
7S I1 Measure first	7S: Systems (large gap)		
7S I2 Authority, not just an owner	7S: Structure (large gap)		
7S I3 Keep the knowledge	7S: Skills and Staff		
E1 [team]	PEST:		
E2 [team]	PEST:		
E3 [team]	PEST:		

3.4 GenAI Use Evaluation Box 1: Strategic Analysis

GUIDANCE FOR THE TEAM: GenAI Use Evaluation Box 1 (delete this guidance box before submission)

- The spec requires exactly one box at the end of this section, max 250 words. If GenAI was used in the section and the box is missing, the section gets no marks.
- Give two specific examples. For each, say how the GenAI output was (1) tested or validated, (2) accepted, rejected or modified using your own judgement, and (3) checked against relevant evidence and IIT's context. Show how it fed team discussion and decisions.
- Write only what actually happened, in your own words. It must match GenAI_Use_Log.md and anything else your team used GenAI for.

Facts about Claude's help in Strategic Analysis (from GenAI_Use_Log.md):

- Claude reviewed the 7S draft against the rubric and, at Thisen's request, revised it (version 2): new framework justification with rejected alternatives and limitations, gap ratings, the fit section (M1–M3), insights I1–I3, the Appendix D assumptions table and the 7S fit diagram. The text went from about 1,300 to 850 words. Version 1 is in 'Past Iterations'.
- Claude found and added two benchmarks with sources: NSBM (Iddawela and Yatawara, 2021) and Monash (UNFCCC, 2018).
- Claude checked about 45 citations in the PEST against their sources and applied the corrections shown in comments (PDPA date, tariffs, EPR Act, inflation maths, citation years); it flagged claims it could not

verify.

- Example candidates, but only if your team really did the checking: how you checked the PDPA correction against the gazette sources and changed your threat rating; whether you agreed with or changed the 7S gap ratings.

GenAI Use Evaluation Box 1: Strategic Analysis

Tools used and purpose: [who used which GenAI tool, for what]

Example 1 – [name]: What GenAI produced [ ]. How we tested or validated it [ ]. What we accepted, rejected or changed, and why [ ]. Evidence and IIT context we checked it against [ ].

Example 2 – [name]: What GenAI produced [ ]. How we tested or validated it [ ]. What we accepted, rejected or changed, and why [ ]. Evidence and IIT context we checked it against [ ].

How this shaped our discussion and final decisions: [ ]

4 Business Recommendations

GUIDANCE FOR THE TEAM: Business Recommendations, 25% (delete this box before submission)

- Marks: strategic programme and choices 15%, MVP value proposition 5%, MVP business process map 5%.
- Suggested length: about 740–850 words for the whole section (it is about 2,100 now).

What the spec requires, and where this draft stands:

- A wider long list, then criteria, then a focused programme. The long list is here; the criteria and scores are a template in 4.2 that the team must complete.
- Programme highly dependent on digital technology, with a justification per initiative. Mostly there; state clearly which initiatives are selected.
- Dependencies and synergies (4.4), significant alternatives with reasons (4.5), and trade-offs: cost, student experience, accessibility, privacy, security, feasibility (4.6).
- ONE MVP (the highest-priority initiative), with a value proposition using a framework (4.7) and a business process map (4.8). The draft labels several initiatives as the MVP, so pick one.
- Ask your tutor whether the programme must have four initiatives: the Digital Strategy part of the spec mentions 'the four business initiatives'.

4.1 Long list of potential initiatives

- Define the IIT Mission & Vision
- Define the IIT Business Objectives

1. IIT Green Intelligence – Unified Sustainability Data Platform

Description:
Develop a centralised digital platform to collect, consolidate, monitor and analyse sustainability-related data across IIT. The platform will integrate information from smart electricity and water meters, utility bills, waste records and IT asset registers. It will provide management with a central dashboard displaying sustainability performance, resource consumption and progress towards established targets.

Why this is appropriate for IIT:

- IIT already has smart meters and recycling facilities, but sustainability information is not consolidated or consistently monitored.
- Establishing a centralised data source will help IIT overcome its existing lack of a sustainability baseline and measurable performance indicators.
- It supports evidence-based decision-making and provides the foundation for measuring progress against IIT's sustainability goals.

Dependencies and synergies:

- Acts as the central data foundation for the other initiatives.
- Receives information from energy, water, waste and IT asset management activities.

- Supplies data for sustainability reporting, ranking submissions and management decisions.

Core MVP priority

2. Smart Energy and Water Management Programme

Description:
Implement a digitally supported resource management programme to monitor and improve electricity and water consumption across IIT. This will initially involve integrating existing smart meter readings into the sustainability platform, analysing consumption patterns, identifying excessive usage and monitoring the performance of energy and water conservation measures. Future enhancements could introduce predictive analytics, automated controls and leak detection.

Why this is appropriate for IIT:

- Energy and water consumption directly contribute to IIT's operational costs and environmental footprint.
- IIT has established targets for reducing electricity-related emissions and mains water consumption.
- Existing smart meters provide an opportunity to introduce data-driven monitoring without initially investing in complex technologies.

Dependencies and synergies:

- Depends on the Unified Sustainability Data Platform for collecting and analysing consumption data.
- Provides measurable information for sustainability reporting.
- Can support future AI-driven energy optimisation and automated water monitoring.

Core MVP priority

3. IIT Circular Technology Hub – IT Asset Lifecycle Management

Description:
Establish a digital IT asset management system to monitor the lifecycle of electronic equipment, from acquisition to retirement and disposal. Each asset can be assigned a unique QR code to record its purchase date, location, condition, maintenance history and disposal status. The initiative will also support the refurbishment, reuse, donation and responsible recycling of retired equipment through certified handlers.

Why this is appropriate for IIT:

- As a technology-focused higher education institution, IIT regularly uses computers and other electronic equipment.
- A structured asset management system can help extend device lifespans, reduce unnecessary purchases and improve accountability for e-waste.

- It directly supports IIT's targets for responsible IT disposal and extending device lifespans.

Dependencies and synergies:

- Uses the central sustainability platform to consolidate asset lifecycle and e-waste information.
- Provides data for measuring equipment lifespan, reuse rates and responsible disposal.
- Can collaborate with student technology projects to support device repair and refurbishment.

Core MVP priority

4. IIT Green Engagement Platform and Living Lab

Description:
Develop a digital engagement platform that encourages students and staff to participate in campus sustainability activities. The platform can provide sustainability challenges, activity updates, participation tracking and information on the environmental impact of campus initiatives. It can also act as a channel for coordinating student-led sustainability projects, GreenTech innovation challenges and industry collaborations.

A digital attendance and mobile student ID module using QR codes or NFC could also be introduced to reduce paper-based attendance processes and reliance on plastic ID cards.

Why this is appropriate for IIT:

- IIT has an opportunity to use its technology-focused student community to develop and test practical sustainability solutions.
- A digital engagement platform can improve participation and make sustainability activities more visible.
- Integrating sustainability projects into student learning can connect environmental objectives with IIT's academic and technological strengths.

Dependencies and synergies:

- Uses sustainability information from the central platform to display campus progress and environmental impact.
- Creates opportunities for students to develop prototypes that support other initiatives.
- Can work with industry partners to identify real-world sustainability challenges and pilot student-developed solutions.

Core MVP priority – phased rollout

5. Sustainability Reporting and Ranking Readiness

Description:
Establish a structured digital reporting process to monitor IIT's progress against its sustainability objectives and prepare evidence for external sustainability assessments. The initiative will involve developing a KPI framework, mapping activities against relevant Sustainable Development Goals (SDGs), maintaining supporting evidence and producing periodic

sustainability reports. IIT can initially prepare for UI GreenMetric and subsequently consider participation in the Times Higher Education (THE) Impact Rankings.

Why this is appropriate for IIT:

- IIT needs a transparent way to demonstrate its sustainability performance to students, staff, management and external stakeholders.
- Formal reporting will encourage accountability and help identify areas requiring improvement.
- Participation in recognised sustainability assessments can strengthen IIT's institutional reputation and demonstrate its commitment to sustainable development.

Dependencies and synergies:

- Relies on data collected through the Unified Sustainability Data Platform.
- Uses performance information from the energy, water, waste and circular IT initiatives.
- Depends on accurate data collection and evidence maintained by the relevant departments.

Core MVP output

6. Zero-Waste Smart Campus and Sustainable Dining

Description:
Introduce a digitally supported waste management programme to reduce waste generation and improve recycling across IIT. This will include monitoring waste quantities, introducing digital waste records, improving waste segregation, encouraging reusable food containers and tracking food waste generated by campus dining facilities. A basic reporting mechanism can help identify areas producing the highest volumes of waste.

Why this is appropriate for IIT:

- Campus dining and everyday student activities can contribute to plastic and food waste.
- IIT has an opportunity to build on its existing recycling facilities by introducing measurable waste reduction practices.
- The initiative directly supports the institution's zero-waste and single-use-plastic reduction objectives.

Dependencies and synergies:

- Supplies waste generation and recycling data to the central sustainability platform.
- Can be integrated with the student engagement platform through waste reduction challenges.
- Provides measurable information for sustainability reporting.

Implementation consideration: Begin with manual waste weighing, digital records and improved segregation. Computer-vision waste sorting and smart bins can be considered later if there is a demonstrated need.

7. Sustainable Digital Communities and Digital Inclusion

Description:
Develop a digitally enabled community outreach programme that expands access to technology and digital skills among underserved young people. Activities could include online learning resources, digital skills workshops, student mentoring, refurbished device donations and partnerships with schools and community organisations.

Why this is appropriate for IIT:

- Digital inclusion is an important part of the institution's broader sustainability and social responsibility objectives.
- IIT's academic expertise and student community provide opportunities to deliver technology-related outreach activities.
- Refurbishing and donating usable equipment can connect digital inclusion with the circular IT initiative.

Dependencies and synergies:

- Can receive refurbished devices through the Circular Technology Hub.
- Can use student volunteers and projects coordinated through the Green Engagement Platform.
- Requires partnerships with schools, community organisations and relevant stakeholders.

Implementation consideration: Start with partnerships, mentoring and refurbished device programmes before investing in a dedicated outreach platform.

8. Green Procurement and Sustainable Campus Operations

Description:
Introduce a digitally supported sustainable procurement and operational management policy to ensure that environmental considerations are incorporated into IIT's purchasing and administrative processes. This could include evaluating suppliers based on environmental practices, prioritising energy-efficient equipment, reducing unnecessary paper purchases and maintaining digital records of procurement decisions.

Why this is appropriate for IIT:

- Procurement decisions influence the environmental impact and long-term operating costs of the institution.
- Sustainable purchasing can support IIT's energy efficiency, waste reduction and circular IT objectives.
- Introducing environmental criteria into procurement will help ensure that sustainability becomes part of routine institutional decision-making.

Dependencies and synergies:

- Supports the Smart Energy and Water Management Programme through energy-efficient purchasing.
- Supports the Circular Technology Hub by prioritising durable, repairable and reusable equipment.
- Can provide procurement information for the central sustainability database and reporting process.

Implementation consideration: Begin with a sustainable procurement policy and digital supplier records rather than developing a separate procurement application.

4.2 Evaluation criteria and weighted scoring

We started with ten credible initiatives from the brief, our research and team ideas, and compared them using five weighted criteria. Impact and fit with our analysis carry the most weight, because an initiative that does not fix IIT's real gaps will not last.
Sustainability impact (30%): how much it moves IIT's seven draft goals. **Fit with our analysis (20%):** whether it closes the Structure and Systems gaps or uses an opportunity we found. **Cost and feasibility (20%):** whether it fits the LKR 80 million three-year budget, reuses existing systems and can be built by one developer and final-year students. **Digital dependence (15%):** the spec asks for initiatives that are driven by digital technology. **Speed to value (15%):** how quickly it gives results that can be measured and reinvested.
The team scored each initiative from 1 (poor) to 5 (strong). The scores are our judgement based on our analysis, so they guide the decision rather than make it.

Table 4: Weighted scoring of the long list (scores 1–5) [team to complete]

#	Initiative	Impact 30%	Fit 20%	Cost 20%	Digital 15%	Speed 15%	Weighted	Decision
1	IIT Green Intelligence – Unified Sustainability Data Platform							
2	Smart Energy and Water Management Programme							
3	IIT Circular Technology Hub – IT Asset Lifecycle Management							
4	IIT Green Engagement Platform and Living Lab							
5	Sustainability Reporting and Ranking Readiness							
6	Zero-Waste Smart Campus and Sustainable Dining							
7	Sustainable Digital Communities and Digital Inclusion							
8	Green Procurement and Sustainable Campus Operations							

4.3 Recommended strategic programme

[Team to write: name the programme, list the selected initiatives with the reason for each, and say which one is the MVP]

1. IIT Green Intelligence – Unified Sustainability Management Platform

MVP foundation
SDG 7, 12, 13, 16, 17

Objective: Establish a centralised system to monitor, measure and report IIT's sustainability performance.

MVP deliverables:

- Develop a central sustainability database and digital dashboard.
- Consolidate existing smart-meter readings, electricity bills, water usage and waste records.
- Establish a baseline for campus energy consumption, water usage, waste generation and carbon emissions.
- Introduce sustainability KPIs and departmental reporting responsibilities.
- Establish a Sustainability Committee.
- Publish a basic annual sustainability performance report.

Why it makes the MVP: This addresses IIT's most significant existing weakness: the absence of consolidated data and measurable sustainability performance.

It also provides the data infrastructure required by the other initiatives.

2. Smart Energy, Water and Waste Management Programme

High-impact operational initiative
SDG 6, 7, 11, 12, 13

Objective: Reduce campus resource consumption through monitoring, efficiency improvements and responsible waste management.

MVP deliverables:

- Integrate existing smart meters into the sustainability dashboard.
- Conduct energy and water consumption audits.
- Introduce energy-saving practices and automated lighting where feasible.
- Introduce water-leak reporting and monitoring.
- Establish waste-segregation and recycling stations.
- Introduce reusable food containers and reduce unnecessary single-use plastics in canteens.
- Begin measuring food waste and general waste generation.

Why it makes the MVP: It produces visible environmental improvements and creates opportunities for operational cost savings.

Importantly, I would not introduce expensive AI-driven energy optimisation or computer-vision smart bins immediately. Begin with monitoring, basic analytics and low-cost interventions.

3. IIT Circular Technology Hub – IT Asset Lifecycle Management

Strong institutional differentiator
SDG 9, 10, 12

Objective: Establish a structured approach to extending the lifespan of IT equipment and responsibly managing electronic waste.

MVP deliverables:

- Introduce QR-based tagging of institutional IT assets.
- Establish a digital IT asset inventory.
- Track equipment purchases, usage, repairs and retirement.
- Establish an internal equipment reuse and donation process.
- Organise student-led refurbishment workshops.
- Partner with certified e-waste handlers.
- Maintain records of recycled, refurbished and donated equipment.

Why it makes the MVP: This directly addresses IIT's responsible IT and e-waste goal while creating opportunities for practical student involvement.

It also combines two benefits: environmental protection and improved digital access for underserved communities.

4. IIT Green Engagement Platform and Living Lab

Student engagement and innovation
SDG 4, 9, 12, 17

Objective: Coordinate student and staff sustainability activities while using IIT's academic and technological expertise to develop practical sustainability solutions.

MVP deliverables:

- Develop a simple web-based student and staff engagement platform.
- Introduce sustainability challenges and activity tracking.
- Record student club and departmental sustainability activities.
- Introduce a student-led Green Technology Innovation Challenge.
- Use campus sustainability data for final-year projects and research.
- Establish initial industry partnerships for sustainability projects.
- Introduce QR-based digital attendance as an optional module, replacing paper attendance sheets where integration is feasible.

Why it makes the MVP: IIT can use its own students and academic expertise to improve its sustainability performance.

This is also an opportunity to differentiate IIT from institutions that primarily focus on physical green-campus development.

I would avoid building a complicated mobile application immediately. A web-first platform with basic activity logging and a simple points system is sufficient for the MVP.

5. Sustainability Reporting and Ranking Readiness

Institutional credibility
SDG 16, 17

Objective: Establish transparent sustainability reporting and prepare IIT to participate in recognised international sustainability assessments.

MVP deliverables:

- Establish a sustainability KPI framework.

- Map relevant indicators against the UN SDGs.
- Prepare an initial sustainability performance report.
- Identify relevant UI GreenMetric and THE Impact Rankings criteria.
- Develop a sustainability evidence repository.
- Publish key sustainability indicators through a public-facing dashboard.

Why it makes the MVP: IIT needs to demonstrate its sustainability progress rather than simply announce sustainability initiatives. This is particularly important if IIT wants to compete with established institutions such as NSBM and the University of Kelaniya.

4.4 Dependencies and synergies between initiatives

The initiatives are designed as a set rather than a list. The Data Hub is the foundation: Initiatives 3, 4 and 5 all use its data, so building it first avoids paying for the same thing twice. There are also synergies between the others. Devices that the Asset Tracker marks as reusable can be donated to IIT's schools outreach work through DDL, which supports the inclusion goal at almost no extra cost. Savings from Initiatives 1 and 3 are reinvested into 4 and 5, and the Living Lab gives final-year students real projects, adding capacity beyond the one developer IIT plans to hire.

A non-digital enabler is also needed. Our structure analysis showed that the Sustainability Office has an owner but no power. Technology alone will not fix this. We therefore recommend that IIT sets up a cross-functional sustainability steering group in Year 1, chaired by senior management, with a named data owner from facilities, IT, each school and the student body. This costs very little, but without it the dashboards would show problems that nobody has the authority to fix.

4.5 Alternatives not selected

Table 5: Significant alternatives considered but not selected

Alternative	Reason for not selecting it for the initial MVP
Campus Digital Twin	Requires substantial investment, reliable real-time data and a higher level of technical maturity.
Computer-Vision Smart Waste Bins	More expensive and complex than necessary when manual waste weighing and digital records can initially provide sufficient information.
Blockchain Green Credentials and Carbon Credits	Adds technical complexity without providing a clear advantage over conventional databases and reporting systems.

Carbon Offset Marketplace	Could create greenwashing risks if offsetting is prioritised before measuring and reducing actual emissions.
Smart Mobility and Carpooling Application	Has a less direct relationship with IIT's immediate sustainability measurement and operational priorities.
Biodiversity Monitoring Using Drones and Image Recognition	Requires specialised equipment and technical capabilities, with less immediate value than the core initiatives.
Advanced AI-Based Energy and Water Optimisation	Depends on reliable historical and real-time data. Basic monitoring and baseline establishment should come first.
Facial-Recognition Attendance System	Raises privacy, data protection and potential bias concerns. QR or NFC-based attendance is a simpler alternative.

4.6 Trade-offs and refined sustainability goals

We balanced impact against cost by starting with cheap, data-first initiatives. For privacy under Sri Lanka's Personal Data Protection Act No. 9 of 2022, the app uses building-level data and opt-in accounts. For accessibility it is a light, mobile-first web app in English, Sinhala and Tamil, and for security meters sit on a separate network.

We also suggest three changes to the draft goals. Goal 1 uses a 2025 baseline that does not exist, so IIT should use the first full year of Data Hub data (2027) or estimate 2025 from bills and say so. Goal 2 should start by tagging every device, because IIT cannot manage what it has not counted. Goal 7 should target UI GreenMetric first in 2028, since it focuses on campus operations, before THE Impact Rankings.

4.7 MVP: selection and value proposition

The Data Hub is the MVP because it scored highest on every criterion, can be live in six to nine months by reusing existing meters and cloud services, and every other initiative depends on it. Version one covers electricity and water from existing meters, waste and fuel through a monthly form, alerts, and dashboards for the Sustainability Office, facilities and the public.

We used the Value Proposition Canvas (Osterwalder et al., 2014), which matches users' jobs, pains and gains with what the product offers. The main users are the Head of Sustainability and facilities; management and students are secondary.

Table 6: Value Proposition Canvas for the MVP

Customer profile (what users need)	Value map (what the Data Hub offers)
Jobs: set a baseline and track targets (Head of Sustainability); cut costs and fix faults (facilities); justify the LKR 80m (management); see their impact (students).	Products and services: one dashboard for meter, waste and fuel data; CO2e conversion; alerts; public building dashboard; monthly report template.
Pains: data scattered across meters, bills and spreadsheets; waste only noticed when the bill arrives; slow manual reports; club effort goes unseen.	Pain relievers: reuses existing meters so the baseline starts at once; alerts within hours; automatic monthly figures; checks for missing readings.
Gains: proof of savings to reinvest; credible data for GRI and rankings; recognition as a leading sustainable technology campus.	Gain creators: savings shown in rupees and carbon; data mapped to GRI and UI GreenMetric; public dashboard to show partners and applicants.

The fit is strong for the client: having no reliable data is their biggest pain, and proof of savings unlocks the rest of the programme. The fit is weakest for students, whose main gains come with the GreenIIT app in Year 2.

4.8 MVP business process map

Figure 3 shows the Data Hub's main monthly process as a swimlane diagram. Meters send readings every 15 minutes and facilities enter waste and fuel monthly. The Hub has two decision points: whether the data is valid (if not, facilities fix it) and whether use is above target (if so, facilities investigate). Actions are logged, the Sustainability Office reports monthly and the steering group reviews targets quarterly.

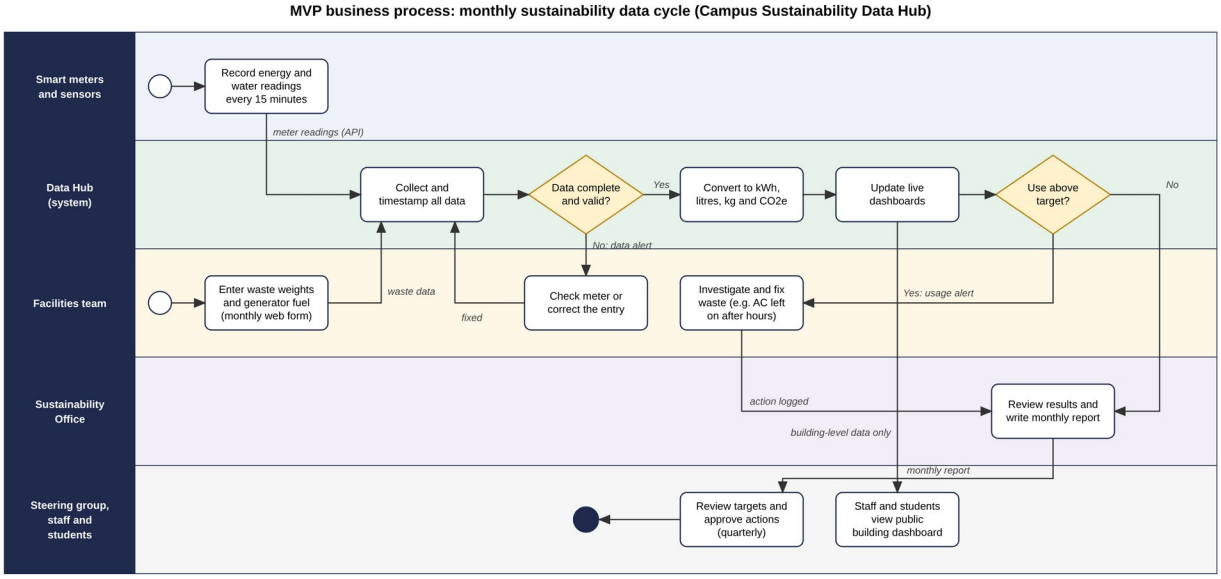

Figure 3: Business process map for the MVP: monthly sustainability data cycle (swimlane, our own diagram)

4.9 GenAI Use Evaluation Box 2: Business Recommendations

GUIDANCE FOR THE TEAM: GenAI Use Evaluation Box 2 (delete this guidance box before submission)

- The spec requires exactly one box at the end of this section, max 250 words. If GenAI was used in the section and the box is missing, the section gets no marks.
- Give two specific examples. For each, say how the GenAI output was (1) tested or validated, (2) accepted, rejected or modified using your own judgement, and (3) checked against relevant evidence and

IIT's context. Show how it fed team discussion and decisions.

- Write only what actually happened, in your own words. It must match GenAI_Use_Log.md and anything else your team used GenAI for.

Facts about Claude's help in Business Recommendations (from GenAI_Use_Log.md):

- In this session Claude reviewed the team's draft against the rubric and compiled it. It did not write, score or select initiatives. The scoring table is an empty template.
- Thisen's earlier draft (IIT_Business_Recommendations.docx) contains a draft AI box saying Claude helped generate an initial long list, challenge the criteria and draft the first Value Proposition Canvas. This session cannot confirm that history, so describe accurately what happened.

GenAI Use Evaluation Box 2: Business Recommendations

Tools used and purpose: [who used which GenAI tool, for what]

Example 1 – [name]: What GenAI produced [ ]. How we tested or validated it [ ]. What we accepted, rejected or changed, and why [ ]. Evidence and IIT context we checked it against [ ].

Example 2 – [name]: What GenAI produced [ ]. How we tested or validated it [ ]. What we accepted, rejected or changed, and why [ ]. Evidence and IIT context we checked it against [ ].

How this shaped our discussion and final decisions: [ ]

5 Digital Strategy

GUIDANCE FOR THE TEAM: Digital Strategy, 30% (delete this box before submission)

- Marks: application portfolio and architecture 15%, level of alignment 5%, implementation plan, evaluation, assumptions and risks 10%.
- Top band (portfolio): 'comprehensive, clear and well-structured portfolio. All elements highly relevant, realistic and aligned to all proposed initiatives and constraints.' Technology choices must come from the capabilities the initiatives need, not from what is new.
- Top band (plan): 'well-structured, concise, and feasible… priorities, sequence and timing are clear and strongly justified'.
- Suggested length: about 880–1,030 words. Use tables for detail and keep the prose for reasoning.

Inputs you already have:

- Brief: LKR 80m over three years; reuse existing IT and facilities; one developer plus final-year students; MVP first; savings reinvested; a long-term aim to share the tools with other institutions (IIT, 2026a).
- PEST: PDPA core duties from 1 January 2027; hardware priced in US dollars (rupee −7.9% in H1 2026); inflation 8% (August 2026); +18% tariffs for GP-2/GP-3; net metering ended (use solar on site); e-waste needs licensed handlers; about 40% of Sri Lankans are offline.
- 7S: strong software and data skills; no carbon accounting, GRI or e-waste expertise; students leave each year, so documentation matters.
- Alternatives table: digital twin, computer-vision bins, blockchain, facial recognition and advanced AI. Pick one as the 'attractive technology not adopted' (5.6).

Further sources (details in 07_References.docx):

- Petersen et al. (2007): real-time feedback cut dormitory electricity use by 32%. IEA (2025): AI building optimisation needs good data first. THE (2026) Sustainability Impact Ratings and the UI GreenMetric Guideline 2025 for reporting design. GRI 302/303/305/306 and the GHG Protocol Scope 2 Guidance for the data model (standards, not checked online here).

5.1 Required digital capabilities

[Team to write: the capabilities each initiative needs (for example data integration, dashboards, asset tracking, engagement, reporting)]

5.2 Application portfolio

Table 7: Proposed application portfolio [team to complete]

Application	Key capabilities	Data needed	Build / buy / reuse	Initiative(s)	Phase

5.3 Architecture and data requirements

[Insert Figure 4: a layered diagram (data sources → integration → data platform → applications → users), showing reuse of existing systems and where personal data is processed]

Figure 4: High-level architecture [team to create]

[Team to write: the main data flows, data owners, quality checks and security (for example meters on a separate network)]

5.4 Alignment of applications to initiatives

Table 8: Alignment of applications to initiatives (tick where an application supports an initiative) [team to complete]

Application	Initiative 1	Initiative 2	Initiative 3	Initiative 4	Initiative 5

5.5 Constraints: security, privacy, ethical and operational

[Team to write: use the inputs in the guidance box; the PDPA start date of 1 January 2027 falls inside your roadmap]

5.6 Technology considered but not adopted

[Team to write: one attractive technology you rejected, and why (cost, data readiness, privacy, energy use)]

5.7 Implementation roadmap and budget phasing

Table 9: Implementation roadmap and budget phasing within LKR 80m [team to complete]

Phase	Timing	Initiatives / applications	Budget (LKR m)	Milestone / go–no-go check
Phase 1 (MVP)				
Phase 2				
Phase 3				
Years 4–5				

5.8 Evaluation: KPIs and success measures

Table 10: Evaluation KPIs [team to complete]

Initiative	KPI	Baseline	Target	Data source	Owner

5.9 Assumptions, risks and conditions for success

Table 11: Assumptions, risks and conditions for success [team to complete]

Assumption or risk	Likelihood	Impact	Mitigation or condition	Owner

5.10 GenAI Use Evaluation Box 3: Digital Strategy

GUIDANCE FOR THE TEAM: GenAI Use Evaluation Box 3 (delete this guidance box before submission)

- The spec requires exactly one box at the end of this section, max 250 words. If GenAI was used in the section and the box is missing, the section gets no marks.
- Give two specific examples. For each, say how the GenAI output was (1) tested or validated, (2) accepted, rejected or modified using your own judgement, and (3) checked against relevant evidence and IIT's context. Show how it fed team discussion and decisions.
- Write only what actually happened, in your own words. It must match GenAI_Use_Log.md and anything else your team used GenAI for.

Facts about Claude's help in Digital Strategy (from GenAI_Use_Log.md):

- Claude has not written any Digital Strategy content. It provided only this structure, the empty templates and the list of verified sources. Record any GenAI use your team makes while writing this section.

GenAI Use Evaluation Box 3: Digital Strategy

Tools used and purpose: [who used which GenAI tool, for what]

Example 1 – [name]: What GenAI produced [ ]. How we tested or validated it [ ]. What we accepted, rejected or changed, and why [ ]. Evidence and IIT context we checked it against [ ].

Example 2 – [name]: What GenAI produced [ ]. How we tested or validated it [ ]. What we accepted, rejected or changed, and why [ ]. Evidence and IIT context we checked it against [ ].

How this shaped our discussion and final decisions: [ ]

6 Project Review for Professional Learning

GUIDANCE FOR THE TEAM: Project Review, 10% (delete this box before submission)

- The spec requires a separate team meeting to prepare this section. Record its date, who attended and the outcome in Appendix A.
- Top band: 'specific and insightful reflection demonstrating excellent collaboration and planning. Excellent reflection on challenges, responses and learning.'
- Give two things that worked well and how they improved the strategy, and two significant weaknesses: what actually happened, a better alternative, and what you learned. Each example must name a specific activity, decision or incident.
- Suggested length: about 290–340 words including the table.

Facts from your files you could reflect on (use only if they are true for your team):

- Drafts were written in parallel. The result was two 7S versions, a SWOT section that was later dropped, two initiative lists with different names, and a draft about 1,450 words over the limit. Would agreeing the structure and word budget earlier have helped?
- The PEST used current, Sri Lanka-specific evidence with impact ratings, which gave the recommendations a strong base. The citation check still found errors, which is a lesson about verifying sources.

6.1 What worked well

[Team to write: two strengths, each with a specific example]

6.2 Significant weaknesses and lessons learned

[Team to write: two weaknesses, each covering what happened, a better alternative and the lesson]

6.3 Individual skills development

Table 12: Skills developed by each team member [each member to complete their own row]

Team member	Skill, capability or area developed	How developed (brief example from the project)	How it may be applied or help in future
Rachel Merrion			
Ranuli Alahakoon			
Manthi Gunaratne			
Thisen Senarathna

Appendices

Appendix A: Group Work Plan

GUIDANCE FOR THE TEAM (delete before submission)

- Mandatory. The spec wants key tasks and deadlines, the roles each member took in each key task, and meetings planned and held, with attendees, purpose and outcomes.
- Table A1 is exported from your Notion 'Coursework Tasks' tracker as it stood on 5 November 2026. Notion has no owner field, so fill in 'Who' and update the status before you submit.

Table A1: Key tasks and deadlines (from the team's Notion tracker, 5 November 2026)

Task	Section	Priority	Due	Status	Who (team to add)
PEST: Technological factors	Strategic Analysis	—	—	Done	
SWOT: Opportunities	Strategic Analysis	—	—	Done	
McKinsey 7S internal analysis	Strategic Analysis	—	—	Done	
IIT corporate structure critical analysis	Strategic Analysis	—	—	Done	
Decide internal framework: 7S or SWOT Strengths/Weaknesses	Strategic Analysis	High	24 Oct 2026	Not started	
Strategic Analysis: GenAI Use Evaluation Box	Strategic Analysis	High	28 Oct 2026	Not started	
Business Recommendations: programme of initiatives	Business Recommendations	High	4 Nov 2026	In progress	
MVP: value proposition and Business Process Map	Business Recommendations	High	6 Nov 2026	In progress	
Introduction and Strategy Development Approach	Intro & Approach	Medium	7 Nov 2026	Not started	
Digital Strategy: app portfolio, architecture and implementation plan	Digital Strategy	High	10 Nov 2026	Not started	
Project Review for Professional Learning	Project Review	Medium	12 Nov 2026	Not started	
Appendices A, B and C (mandatory)	Appendices	High	14 Nov 2026	Not started	
Final assembly, word count check and submit	Final	Urgent	16 Nov 2026	Not started	

Table A2: Meetings held [team to complete]

Date	Meeting (team or Strategic Review)	Attendees	Purpose	Outcomes and actions
	Strategic Review 1 (Weeks 3–4)		Work plan	

Date	Meeting (team or Strategic Review)	Attendees	Purpose	Outcomes and actions
	Strategic Review 2 (Week 5)		Analysis and emerging recommendations	
	Strategic Review 3 (Week 7)		Final recommendations and digital strategy	
	Project review meeting		Section 6	

Appendix B: Feedback Action Log

GUIDANCE FOR THE TEAM (delete before submission)

- Mandatory. For each Strategic Review Meeting give the main feedback, the action agreed, who was responsible and what changed in the report.
- Action plans were due on Blackboard within five days of each meeting, so use them as your evidence.

Table B1: Feedback action log [team to complete]

Meeting	Main feedback	Action agreed	Responsible	What we changed
Weeks 3–4: work plan				
Week 5: analysis and emerging recommendations				
Week 7: final recommendations and digital strategy				

Appendix C: Individual Contribution Statements

GUIDANCE FOR THE TEAM (delete before submission)

- Mandatory. Each member writes their own statement on the work they did for each key task: Strategic Analysis, Business Recommendations and Digital Strategy.
- Statements must match the Blackboard discussion-area evidence and the authors table at the start of the report.

Appendix D: Assumptions used in the 7S analysis

IIT does not publish an organisation chart or internal performance data, and the brief states that no measured data is available (IIT, 2026a). Where we could not find firm evidence we made the assumptions below. Each one is marked * in Table 2 or Figure E1.

Table D1: Assumptions, why they are reasonable and how they could be checked

#	Assumption	Why it is reasonable	How it could be checked
1	Most decisions are made centrally by senior management ("fast, top-down decisions").	IIT is a founder-led private company within the Informatics Group, whose chairman founded IIT (IIT, n.d.d). The Sustainability Office and LKR 80m budget were approved as top-level decisions (IIT, 2026a).	Ask the Head of Sustainability how the programme and budget were approved.
2	The Sustainability Office has no line authority over schools, IT or facilities.	The office is new, and the brief says sustainability activity is run by clubs and lecturers and is not coordinated (IIT, 2026a).	Confirm the office's reporting lines and decision rights with the Head of Sustainability.
3	Finance, HR and Admin, IT Services, and Facilities and Estates exist as separate corporate functions (Figure 2).	Every multi-campus institution of IIT's size needs these functions, and the brief refers to IT equipment and facilities being managed (IIT, 2026a).	Check against IIT's staff directory or ask IIT administration.
4	Lecturers focus mainly on teaching and have little spare time outside it.	Most of IIT's degrees are taught programmes validated by partner universities (IIT, n.d.a), and the brief plans to rely on one developer and students rather than staff time (IIT, 2026a).	Short interview with two or three lecturers, or IIT's workload model.
5	IIT relies on a small number of senior people for major decisions.	This is typical of founder-led organisations with a strong strategic apex (Mintzberg, 1979).	Discuss with the Lead Consultant or the Head of Sustainability.

Appendix E: IIT organisational structure

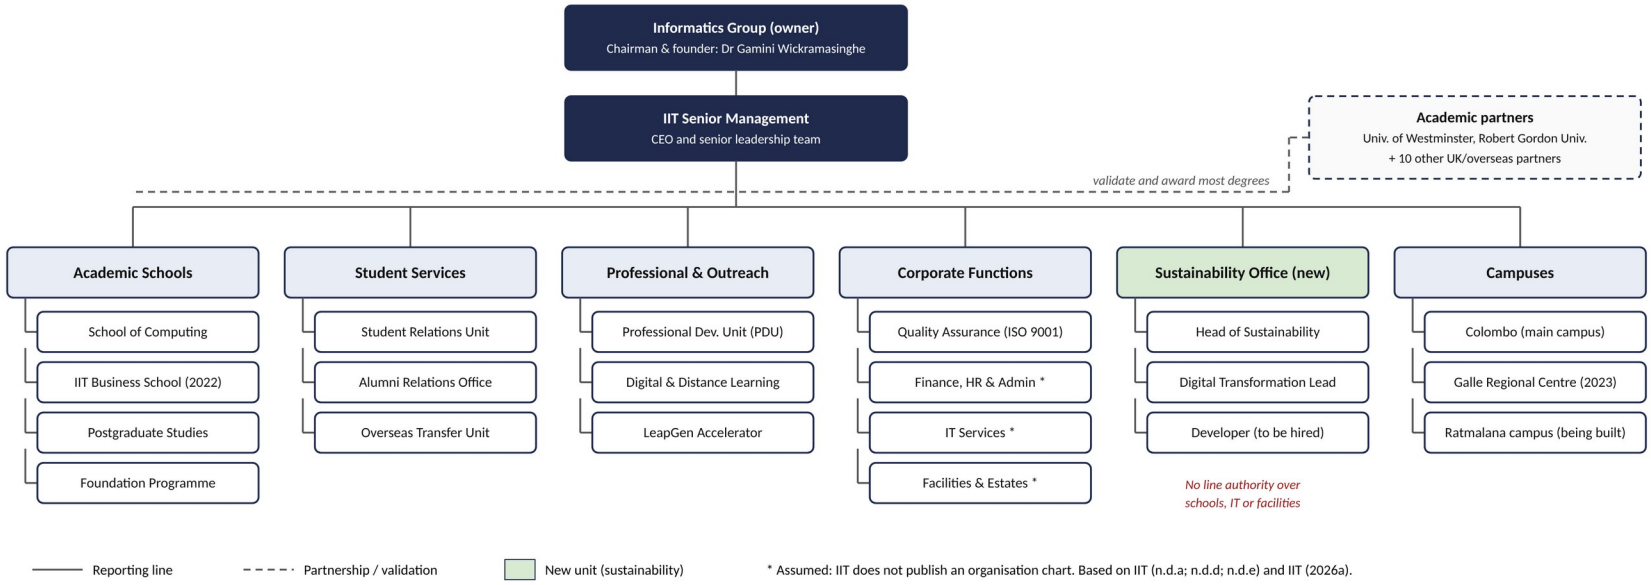

Figure E1: Organisational structure of IIT (2026)

Boxes marked * are assumed, because IIT does not publish an organisation chart (see Appendix D).

Table E1: Critical assessment of IIT's corporate structure (Mintzberg, 1979; Johnson et al., 2020)

Part of the structure	Current situation	Critical analysis	Rating
Ownership and governance	Private BOI-registered company within the Informatics Group, with the founder as group chairman.	Long-term owner commitment and fast decisions, as shown by the quick approval of the Sustainability Office and the LKR 80m budget. But a private group has no duty to report publicly, and sustainability spending competes with commercial priorities across the group.	Mixed
Top management	Central senior management, with most decisions made at the top.	Clear direction and quick action. However, it depends on a few people, and new ideas from lecturers or clubs have no formal route upwards, so many good activities stay small.	Mixed
Academic schools	Split by subject: Computing, Business School, postgraduate and Foundation.	Strong specialist expertise in each school. But the schools work in silos, and there is no shared structure for a cross-cutting goal like embedding sustainability in every programme by 2027.	Mixed
Partner university model	Most degrees are validated by partners, mainly Westminster and RGU, among twelve partners.	Brings international quality and reputation. But course content partly depends on partner approval, which slows curriculum change. IIT's own UGC-approved BBA, launched in September 2026 (IIT, 2026c), gives it more freedom from now on.	Mixed
Support and specialist units	SRU, Alumni, Overseas Transfer, PDU, DDL, LeapGen and other units.	These give IIT ready-made channels: DDL for schools outreach, PDU for corporate training and LeapGen for green start-ups. But they were added one by one and no one coordinates them, so their sustainability work is not joined up.	Strength
Campuses	Colombo campus, a regional centre in Galle, and the new Ratmalana campus under construction.	More sites mean more students reached. But each site needs its own energy, water and waste data, which makes measurement harder. The move to Ratmalana is a rare chance to design data and processes in from	Mixed

		the start.	
Sustainability Office	New office: Head of Sustainability and Digital Transformation Lead, one developer to be hired.	Sustainability finally has an owner. But it is a small staff unit with no authority over facilities, IT buying or courses, and much of the activity sits with clubs and lecturers. Without backing from the top, it could be sidelined.	Weakness
Quality and compliance	ISO 9001:2015 certified, UGC recognised, TVEC registered and BCS accredited.	IIT already runs a documented, audited management system. Sustainability procedures, and later ISO 14001, can be added to it instead of being built from scratch.	Strength

Rating: Strength means this part of the structure already helps the sustainability ambition. Mixed means it helps in some ways but holds IIT back in others. Weakness means it is a barrier that needs to change.
